

## CIARE CDSP1 Firmware Upgrade Instructions

First, download and install CIARE CDSP1 Windows Software Version 1. Some versions of Windows may give you an installation warning, but you can click on Run Anyway and it will install with no problems.

Once installed, power on your CDSP1 and connect to your PC using the supplied USB-A to USB-B cable. If you're upgrading the firmware using a 12 VDC power supply, connect the yellow (V+) and blue (remote) wires to positive and black to ground.

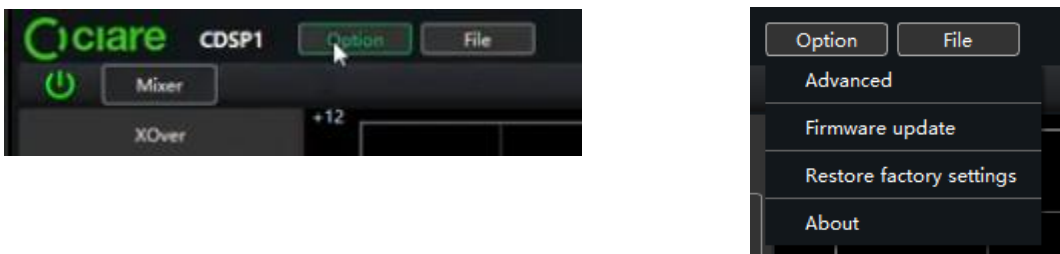

When properly powered-on and connected to your PC, the power icon at the top left of the application will change from red to green.

Next, download the CDSP1 Firmware Upgrade 3\_25\_26.bin file and place it somewhere easy to find, such as on your desktop.

Click on the Option button, select Firmware update, click Load on the popup screen, point the software to the location where the CDSP1 Firmware Upgrade 3\_25\_26.bin file is saved, and then click Update.

Once the firmware is updated, you can then download and use the CIARE CDSP1 Windows Software Version 2 software, which enables password protection. The default password is 000000, which you will be prompted to enter when opening the Version 2 software.

To change this, click on Option, click on Change Password, and enter a unique 6-digit code.
